To whom it may concern:

Re: Plan "B" Organics SolJah Frass 3-2-4

Plan "B" Organics SolJah Frass 3-2-4 is derived from the excreta of Black Soldier Fly (*Hermetia Illucens*) larvae. Black Soldier Fly larvae are raised in an enclosed CFIA inspected facility in British Columbia, Canada where they subsist on a diet of pre-consumer food waste consisting of approximately 70-75% produce and 20-25% bakery products and/or brewery grains. No animal waste, animal by-products, dirt, or garbage is used in the production of SolJah Frass.

Feeding of the larvae is halted to ensure that all feedstock has been fully digested, SolJah Frass is then separated from the larvae by screening. The screened SolJah Frass then enters a heated drying unit to remove residual moisture.

This product is used as an organic fertilizer applied to crops and is not for any type of animal use.

Plan "B" Organics SolJah Frass is all natural, has no additives of any kind, and does not contain any other animal products or by-products. Plan "B" Organics distributes SolJah Frass in its purest form.

Sincerely,

Abraham Harris
